The information and descriptions contained herein are the property of WALCHEM Corporation. Such information and descriptions may not be copied or reproduced by any means, or disseminated or distributed without the express prior written permission of WALCHEM Corporation.

This document is for information purposes only and is subject to change without notice.

Statement of Limited Warranty

WALCHEM Corporation warrants equipment of its manufacture and bearing its identification to be free from defects in workmanship and material for a period of two years from date of delivery from the factory or authorized distributor under normal use and service and otherwise when such equipment is used in accordance with instructions furnished by WALCHEM Corporation and for the purposes disclosed in writing at the time purchased, if any. WALCHEM Corporation's liability under this warranty shall be limited to replacement or repair, F.O.B. Holliston, MA U.S.A. of any defective equipment or part which, having been returned to WALCHEM Corporation, transportation charges prepaid, has been inspected and determined by WALCHEM Corporation to be defective.

THIS WARRANTY IS IN LIEU OF ANY OTHER WARRANTY, EITHER EXPRESS OR IMPLIED, AS TO DESCRIPTION, QUALITY, MERCHANTABILITY, FITNESS FOR ANY PARTICULAR PURPOSE OR USE, OR ANY OTHER MATTER.

TABLE OF CONTENTS

Thank you for choosing a Walchem EH or EZ Series metering pump. This instruction manual deals with the correct installation, operation, maintenance and troubleshooting procedures for the EHB, EHC and EZ model metering pumps. Please read through it carefully to ensure the optimum performance, safety and service of your pump.

1.0 INTRODUCTION

1.1 Safety and Caution Notes

Always wear protective clothing, eye protection and gloves before working on or near a metering pump. Follow all recommendations of the supplier of the solution being pumped. Refer to the MSDS from the solution supplier for additional precautions.

Walchem EH and EZ Series metering pumps should be installed where ambient temperatures do not exceed 122°F (50°C) or do not fall below 32°F (0°C), or where pump or tubing are directly exposed to sunlight.

WARNING Risk of electrical shock! This pump is supplied with a grounding conductor and grounding-type attachment plug. To reduce the risk of electrical shock, be certain that it is connected only to a properly grounded, grounding type receptacle with ratings conforming to the data on the pump data plate. Prior to performing any maintenance on a pump, disconnect the pump from the electrical power source.

Plumbing Precautions

All tubing must be securely attached to the fittings prior to starting the pump (see Section 2.3). Only use Walchem tubing with your pump. Tubing should be shielded to prevent possible injury in case of rupture or damage. UV resistant tubing should be used if the tubing is exposed to UV light. Always adhere to local plumbing codes and requirements. Be sure that the installation does not constitute a cross connection. Walchem is not responsible for improper installations. Prior to performing any maintenance on a pump, depressurize the discharge tubing.

If you are pumping downhill or into little or no system pressure, a back pressure/anti-siphon device must be installed to prevent over-pumping. Contact your Walchem distributor for additional information.

Solution Compatibility

CAUTION! This pump has been evaluated for use with water only. The suitability of this pump for use with liquids other than water (such as acid and alkaline) is the responsibility of the user. For liquids other than water, select the best-suited liquid end material combination using a chemical compatibility chart.

1.2 Principle of Operation

The EH and EZ series electronic metering pumps consist of a pump unit, a drive unit, and a control unit. The drive unit is an electromagnetic solenoid. When the solenoid coil is energized by the control unit the armature shaft moves forward due to the magnetic force of the solenoid. The shaft is attached to a PTFE faced diaphragm which is part of the pump unit. The diaphragm is forced into the pump head cavity decreasing volume and increasing pressure which forces liquid in the pump head out through the discharge check valves. When the solenoid coil is de-energized, a spring returns the armature to its starting position. This action pulls the diaphragm out of the head cavity increasing volume and decreasing pressure. Atmospheric pressure then pushes liquid from the supply tank through the suction check valves to refill the pump head.

1.3 Model Code

1 Pump Series

EH Electronic metering pump with external pulse control or manual speed control (adjustable to 360 strokes per minute) and manually adjustable stroke length. (Typical turndown ratio 125:1.)

EZ Electronic metering pump with manual speed control (adjustable to 360 strokes per minute)

2 Capacity/Pressure Rating (See Section 1.4 for detailed chart.)

3 Control Module

D For use on all EZ models, features digitally adjustable speed and fixed stroke length

R For use on all EHB & EHC models, features external pulse control.

Y For use on all EHB & EHC models, features analog and external pulse control with pulse divide and multiply capability.

4 Voltage

1 115 VAC, 50/60 Hz

2 230 VAC, 50/60 Hz

5 Liquid End (See Section 1.4 for detailed chart.)

6 Options

C High Compression Head: Supplied standard with auto air vent valve in place of manual air vent valve. Available for EHB10, EHB15, EHC15 and EHC20 sizes with -VC liquid ends only.

M Multifunction Valve is supplied in place of the manual air vent valve. Available for the EZ and EHB/C 10-20 sized pumps with VC, VE, VF, PC, PE, PCH and PEH liquid ends. Not available with the AAVV feature.

A Auto Air Vent Valve supplied in place of manual air vent valve. Available for EZ and EH Series in B10, B15, C15 and C20 sizes with – VC liquid ends only.

H High Pressure Head available only for PC/PE liquid ends. Available for EHB10 and EHC15 sizes only. Rated @ 215 PSI.

1.4 Specifications

Electrical	50/60 Hz, single phase			
	EHB/EZB	115 VAC±10%	0.9 Amp max.	16 watt avg.
		230 VAC±10%	0.4 Amp max.	16 watt avg.
EHC/EZC	115 VAC±10%	1.4 Amp max.	24 watt avg.	
	230 VAC±10%	0.6 Amp max.	24 watt avg.	

Operating Conditions

Ambient temperature	32°F to 122°F (0°C to 50°C)
Relative humidity	30% to 90% non-condensing
Liquid temperature	32° to 104°F (0 to 40°C) for PVC based liquid ends 32° to 140°F (0 to 60°C) for PP, PVDF, SS based liquid ends

Capacity/Pressure Rating

Size	Maximum Output Capacity		Output per Stroke (mL)		Maximum Pressure ³		Connection Size (in) Tubing O.D. ²
	(Gal/hr)	(mL/min)	Min.	Max.	PSI	MPa

2.0 INSTALLATION

2.1 Unpacking

Open the shipping carton and inspect contents for damage. If any items are missing or damaged contact your local distributor.

Pumps are pre-primed with water at the factory. If the application is not compatible with water, drain and dry before use. Be sure to remove caps from fittings before attaching tubing.

CAUTION: Head bolts may have loosened during storage or shipment. Be sure to check and tighten to 19 lb-in torque, if necessary.

Do not handle or move the pumps using the Control Module only. The pump should be supported by the base or drive unit during handling

2.2 Location

Choose a location for the pump which is clean, dry, close to an electrical outlet, and allows convenient access to stroke length control, frequency control, and tubing connections. Avoid areas where ambient temperature exceeds 122°F (50°C) or falls below 32°F (0°C), or where the pump or tubing would be exposed to direct sunlight.

This pump is cord connected and not intended for permanent mounting to a building structure. However, temporary mounting to stabilize the pump during operation may be necessary as long as tools are not required for the installation or removal of the pump.

Flooded suction (mounting the pump below the level of liquid in the supply tank) is strongly recommended, especially when pumping liquids that readily generate gas bubbles. Sodium hypochlorite and hydrogen peroxide are common examples of such liquids. (See Figure 1.)

If flooded suction mounting is not possible, a shelf adjacent to (but not directly above) the supply tank often works well. (See Figure 2.) The supply tank or cover can also be used if it has provisions for mounting a pump. (See Figure 3.) In any case, the total suction lift should not exceed 5 ft (1.5m).

Figure 1
Flooded Suction

Figure 2
Shelf Mount

Figure 3
Tank Mount

Figure 4 Connecting Tubing

2.3 Supply Tubing

The supply tubing run should be as short as possible. For flooded suction mounting, install a shut-off valve with an appropriate tubing connector at the tank outlet. Cut a length of tubing from the coil supplied and install between the shut-off valve and the pump inlet fitting. For suction lift applications, slide on the ceramic weight, then install a foot valve on one end of suction tubing. Cut the tubing to a length such that the foot valve hangs vertically about 1 in (25mm) above the bottom of the tank. Avoid any loops in the tubing run that could form a vapor trap. Running the tubing through a length of pipe will help to keep tubing straight. Total vertical suction lift should be no more than 5ft. (1.5m). Reference Figure 4.

Attach tubing as shown in Figure 5. First slide the coupling nut, small end first, onto the tubing. Push the tubing over the valve housing tip *all the way to the valve housing shoulder*. (Tip: if the tubing is stiff from cold, dip the tubing end in hot tap water for a few minutes so it will slide on and flare out more easily. Push the coupling nut onto the threads. Apply some pressure on the coupling nut and tubing while tightening the nut, making sure the tubing has not backed off of the shoulder of the valve housing.

WARNING: *All fittings and coupling nuts should be tightened by hand only. If necessary, a small tool may be used to make it snug. DO NOT use excessive force or large wrenches.*

The coupling nut should not bottom out completely against the fitting. If this happens during connection, either the tubing has slid down the shoulder while tightening, or the tubing has been pinched. Remove the coupling nut, re-cut the tubing and re-connect.

WARNING: *If there is any leakage around the coupling nut and it appears to have been installed correctly, DO NOT TIGHTEN the coupling further! Release pressure in the line, disconnect tubing, re-cut and re-connect. Tightening of misinstalled tubing may cause the tubing to pop off under pressure.*

Figure 5 Attach Tubing

2.4 Discharge Tubing

Cut a length of tubing long enough to go from the pump to the application (injection) point. Additional tubing can be ordered from your distributor. Avoid sharp turns or bends and hot surfaces. Routing tubing through rigid pipe such as PVC pipe is recommended for long runs and/or as protective shielding against corrosive chemicals. If applicable, install the injection valve in 1/2" NPT thread at the injection point (see section 2.5) and connect the discharge tubing to the injection valve.

Attach tubing as described in section 2.3 and as shown in Figures 5 and 6. Note: Some models have an air vent valve with two outlet connections. The connection marked 'OUT' is the discharge side to the application point. (Fig 6). Attach a second length of tubing to the air vent side marked ('AIR') and route back to the chemical solution tank or drum. On the larger pumps (30 & 35 sizes), the air vent valve connections are not marked, however, the discharge side is the vertical (UP) connection and the air vent connection is on the side of the valve.

Figure 6 Air Vent Valve Tubing

2.5 Installing Injection/BackPressure Valve

A fitting or tee with 1/2" NPTF threads and with sufficient depth will accept the injection valve assembly. If required, trim off an amount of the extension tip until it fits your fitting or tee. (Fig. 7.)

The position of the injection/back pressure valve can be at any orientation as long as the spring is retained in the valve. **DO NOT REMOVE THE SPRING.** Be sure to check and replace the spring as needed. Attach the tubing following the same instructions in section 2.3, connecting the supply tubing.

CAUTION: Some chemicals may have reactions as they are injected into the main flow. For example, sulfuric acid may react with water causing excess heat.

If the chemical is heavier than water, mount the injection valve as close as possible to vertical coming into the bottom of the pipe. This will keep the injection nozzle facing up and keep the heavier chemistry from draining into the pipe and causing adverse reactions within the injection valve and pipe.

In addition to preventing backflow from pressurized lines, the injection valve acts as a back pressure valve when pumping into atmosphere or low pressure applications. However, the back pressure by the injection valve can vary and the valve does NOT act as an anti-siphon valve. If siphoning is a possibility, or if pumping downhill into open atmosphere (open tank), a Walchem MultiFunction valve or a separate back pressure/anti-siphon valve must be installed.

Note: Siphoning can also occur at the tip of the injection valve because of the high flow rate in the main pipe flowing past the small injection nozzle (venturi effect). In this case, an anti-siphon device must be installed to avoid over feeding or siphoning of chemistry.

Figure 7 Injection Valve

See Section 5.0 for complete liquid ends parts list and exploded view.

2.6 Electrical

WARNING Risk of electrical shock! *This pump is supplied with a grounding conductor and grounding-type attachment plug. To reduce the risk of electrical shock, be certain that it is connected only to a properly grounded, grounding type receptacle.*

Connect the pump power cord to a **GROUND**ED outlet supplying proper voltage. Avoid branch circuits that also supply power to heavy machinery or other equipment that could generate electrical interference.

3.0 OPERATION

3.1 Priming

Install the pump as described above. With the pump turned on, set stroke length at 100% and frequency at 100%. If the pump is equipped with an air vent valve, open the knob 1/2 turn. Liquid should move through the suction tubing and into the pump head. When liquid starts running through the vent side tubing, close the air vent knob and continue with output adjustment described below. If the pump has no air vent valve, disconnect the discharge tubing from the injection valve. When liquid enters the discharge tubing at the pump head, stop the pump (set frequency knob to 0% on the R-Control module). Then reconnect the discharge tubing to the injection valve.

If the pump does not self prime, remove the check valve housing on discharge & suction sides to make sure valve cartridges and gaskets are in correct positions (see section 4.2 for correct orientation).

Note: Pumps with FC liquid ends should use flooded suction when priming, due to the hard valve seat material.

3.2 Adjustment

A. EZ Pumps using the 'D' Control Module

If less than full output is required, set the frequency to the appropriate percentage of maximum desired.

Example: Model EZB20D1-VE has maximum output of 1.5 GPH.

Desired output is 1.2 GPH. $1.2 \div 1.5 = 0.8$ or 80%

Set the frequency of the pump to $0.8 \times 360 = 288$ spm by pushing the UP or DOWN arrow keys.

B. EH Pumps using the 'R' Control Module

The pump will operate best with the stroke length at 100%. If less than full output is required, set the frequency to the approximate percentage of maximum desired.

Example: Model EHB20R1-VC has maximum output of 1.5 GPH.

Desired output is 1.2 GPH. $1.2 \div 1.5 = 0.8$ or 80%

Set the frequency knob at 80.

For outputs less than 2% of maximum it will be necessary to also reduce the stroke length. (Minimum recommended stroke length is 40%.)

C. EH Pumps using the 'Y' Control Module

The pump will operate best with the stroke length at 100%. If less than full output is required, set the frequency to the desired strokes per minute using the UP and DOWN arrow keys.

Example: Model EHB20Y1-VC has maximum output of 1.5 GPH.

Desired output is 1.2 GPH. $1.2 \div 1.5 = 0.8$ or 80%

Set frequency of the pump to $0.8 \times 360 = 288$ spm by pushing the UP or DOWN arrow keys.

For very low outputs it will be necessary to also reduce the stroke length. (Minimum recommended stroke length is 40%.)

3.3 Calibration

Figure 8 Calibration

If exact output calibration is required, first prime and adjust the pump as above. Then connect a calibration column to the suction side of the pump. Turn the pump on for one minute and read the amount of liquid pumped from the column. Adjust the frequency up or down as necessary and check the output again. When the desired output is reached, disconnect the calibration column and reconnect the suction tubing. (See Figure 8.) Calibration must be performed with application equivalent back pressure for accurate results.

3.4 External Control

(Not available on EZ pumps)

A. Pumps using the ‘R’ Control Module

For pulse proportional external control of pump frequency, connect the control signal leads to terminals 4 (positive) and 6 (common) inside the control module. The input signal should not exceed 360 pulses per minute. The control signal can be a contact closure type switch or solid state device, however the external circuit should be capable of switching 10 VDC at 2 mA with a pulse width of 10 ms to 100 ms. (See Figure 9.) Do not use a powered control signal.

In order for the pump to operate properly in External Mode, the frequency knob must be set fully counter clockwise so it points to the “E”. (See Figure 10.)

Figure 9

Figure 10

B. Pumps using the 'Y' Control Module

The EH-Y Series is able to operate in both digital and analog external modes. An external stop function is also available.

Display/Keypad Overview

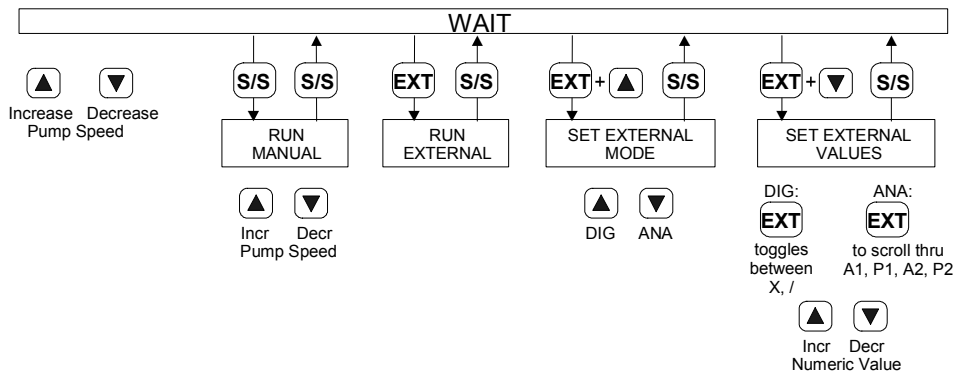

Figure 11 Input Wiring.

EH-Y Quick Reference Guide

S/S Start/Stop Key
 EXT External Key

FROM:	PRESS:	TO:
WAIT MODE	S/S	Run in manual mode
	▼	Decrease frequency (1 to 360 SPM)
	▲	Increase frequency (1 to 360 SPM)
	EXT	Run in EXT ternal mode
	EXT + ▲	SET external mode
	EXT + ▼	SET external values
RUNNING IN MANUAL MODE	▲	Decrease frequency (1 to 360 SPM)
	▼	Increase frequency (1 to 360 SPM)
	S/S	Return to WAIT and stop pump operation
RUNNING IN EXT MODE	S/S	Return to WAIT and stop pump operation
SET EXTERNAL MODE	▲ OR ▼	Toggles between DIG (multiply or divide) and ANA (milliamp input)
	S/S	Accept data and return to WAIT mode
SET EXTERNAL VALUES	DIG	
	EXT	Select '/' (divide) or 'X' (multiply)
	▲	Increase value (1 to 999)
	▼	Decrease value (1 to 999)
	S/S	Accept data and return to WAIT mode
	ANA	
	EXT	Scroll through the following selections: Analog signal level (point 1) Pump speed (point 1) Analog signal level (point 2) Pump speed (point 2)
	▲	Increase value (A from 0.00 to 20.0mA) (P from 0 to 360 SPM)
	▼	Decrease value (A and P)
	S/S	Accept data and return to WAIT mode
STOP	Indicates the external stop function has been activated	
OVER	Indicates one or more input pulses were received prior to completing action required by previous input pulse.	

Digital Mode

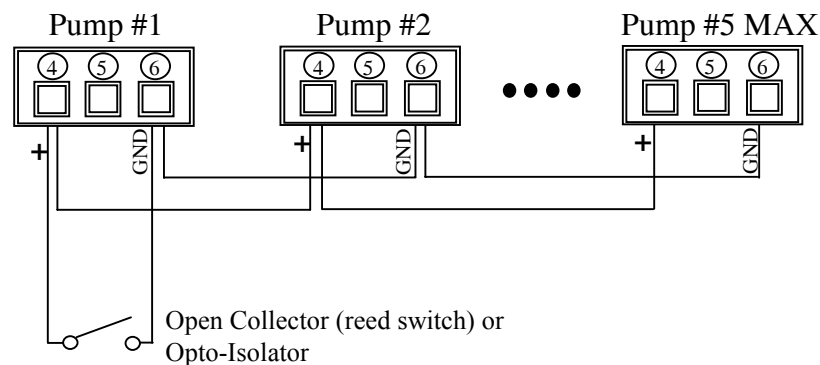

In digital mode, the pump accepts a non-powered pulse signal (contact closure type or solid state device) from a flowmeter or other instrument. The pump can be set to divide pulses by a factor of 1 to 999; or in multiply mode, 1 input pulse can produce 1 to 999 pump strokes. The minimum pulse width on the Y control module is 50 msec.

Connecting a digital input device

Disconnect AC power to the pump. Remove the four screws from the terminal block cover and remove the cover. Remove the cord nut and bushing from the terminal block cover. Remove the terminal block from the connector. Slide the nut and bushing over the external control cable and insert the cable through the terminal block cover. Strip 1/4" insulation from conductors and connect the positive side to terminal 6 and the negative side to terminal 8. (See schematic, below.)

Connecting EH-R Pumps in Parallel for Pulse Control

NOTES:

CAUTION: DO NOT SUPPLY ANY TYPE OF POWERED INPUT TO THE PUMPS!

Polarity Sensitive. Be sure to connect the POSITIVE to POSITIVE and GND to GND with each connection. ONLY a contact closure is acceptable or damage to the pumps will occur.

Maximum current rating of the pump input is 10mA. Each pump draws approximately 2mA. There is a 5 PUMP LIMIT of pumps in parallel.

Make sure the switching device can handle the maximum current in the system.

For Y-Control Modules: Connection is the same as above, except the POSITIVE terminal is Terminal # 6 and the GND is Terminal #8

Sensor Power

The control circuit of the Y Module has the ability to provide 12 VDC at up to 20 mA to power a Hall effect sensor or similar device. Connect the sensor power leads to terminal 4 (positive) and terminal 8 (negative) of the terminal block.

Settings

Start with pump in the **WAIT** state. If it is not currently in wait, press **START/STOP** once.

1. Set it to digital mode

Press and **EXT** simultaneously.

The **SET** indicator is highlighted and DIG (digital) or ANA (analog) will be displayed.

If DIG is displayed, press **START/STOP** to accept that mode.

You will be returned to the **WAIT** state.

If ANA is displayed, press to change to **DIG** and then press **START/STOP** to enter that choice.

You will be returned to the **WAIT** state.

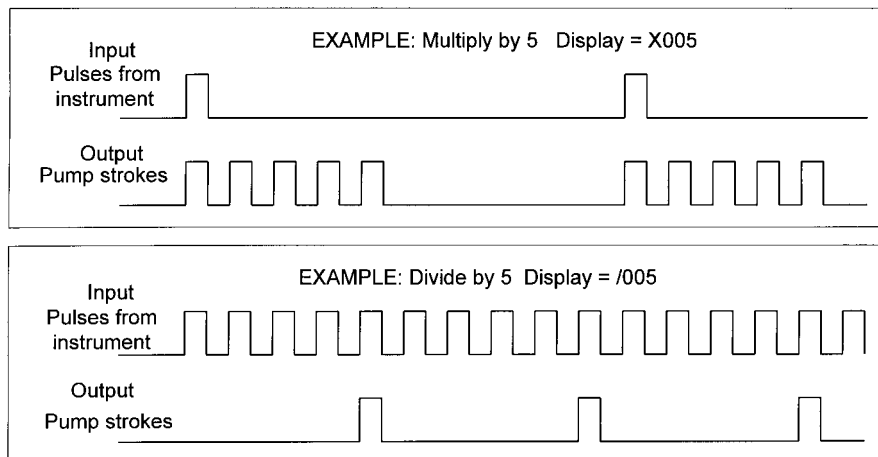

2. Set multiply or divide

To set values for digital operation, press **EXT** and simultaneously. The display will show '/' or 'X' and a number. Now pressing the **EXT** button will alternate between X (multiply) and / (divide).

3. Set the value

or will increase or decrease the multiplier or divider. Pressing a button once will change the value by one. Holding a button down will continuously increment or decrement the value, slowly at first, then rapidly. Press **START/STOP** to accept values and return to **WAIT**.

Press **EXT** to operate the pump in external mode. The pump will now respond to the incoming pulse signal. The stroke length can be adjusted manually to set the volume pumped per stroke.

Analog Mode

In analog mode the pump will accept a milliamp signal and produce a pump speed proportional to the signal level received. The input resistance of this signal is 250 Ω . The pump's response can be fine-tuned by variable set points to meet system requirements.

CAUTION: Open loop signal voltage must not exceed 25 VDC. If the signal voltage is greater than 25 VDC, power down the signal source prior to connection and any open loop condition.

Connecting an analog signal device

Disconnect AC power to the pump. Remove the four screws from the terminal block cover and remove the cover. Remove the cord nut and bushing from the terminal block cover. Remove the terminal block from the connector. Slide the nut and bushing over the external control cable and insert the cable through the terminal block cover. Strip 1/4" insulation from conductors and connect the positive side to terminal 5 and the negative side to terminal 8. (See schematic below.)

Output Power

The control circuit of the Y control module has the ability to provide 12 VDC to power a loop powered device. Wiring is as follows:

Settings

The pump's response to a 4 to 20 milliampere signal can be adjusted to meet almost any need. The adjustment is done by selecting two points. A signal level and a pump speed are entered for each point. These two points determine a straight line and the pump speed resulting from any given signal will be defined by that line. The factory settings for point 1 are 4.0 mA, 0 spm and for point 2 are 20.0 mA, 360 spm. An 'A' in the leftmost position of the display indicates the data shown is Analog signal level. A 'P' indicates Pump speed. The 1 on the right side of the display is highlighted when viewing or changing data for point 1. The 2 is highlighted to indicate data for point 2.

Start with pump in the **WAIT** state. If it is not currently in wait, press **START/STOP** once.

1. Set analog mode.

Press  and **EXT** simultaneously.

The **SET** indicator is highlighted and DIG (digital) or ANA (analog) will be displayed.

If ANA is displayed, press **START/STOP** to accept that mode. You will be returned to the **WAIT** state.

If DIG is displayed, press  to change to ANA and then press **START/STOP** to enter that choice. You will be returned to the **WAIT** state.

2. Set values

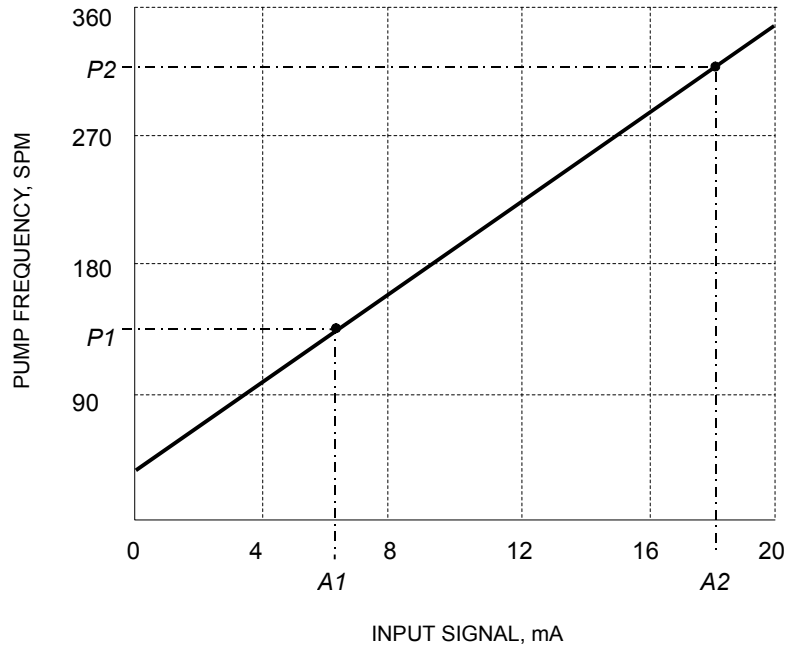

To set values for analog operation, press **EXT** and  simultaneously. The display will show A04.0 (or some value between 00.0 and 20.0 mA) with the point 1 indicator highlighted. Press  or  to adjust the value to the desired analog signal level for point 1.

Press **EXT** to display the pump speed for point 1. The display will show P0 (or some value between 0 and 360 spm) with the point 1 indicator highlighted. Press  or  to adjust the value to the desired pump speed for point 1.

Press **EXT** again to display the analog signal level for point 2, which can be adjusted as for point 1. Pressing **EXT** a third time will display the pump speed for point 2m which can be adjusted as for point 1.

Continued pressing of **EXT** key will scroll through the above four parameters for review or adjustment. When settings are as desired, press **START/STOP** to accept the new values and return to **WAIT**.

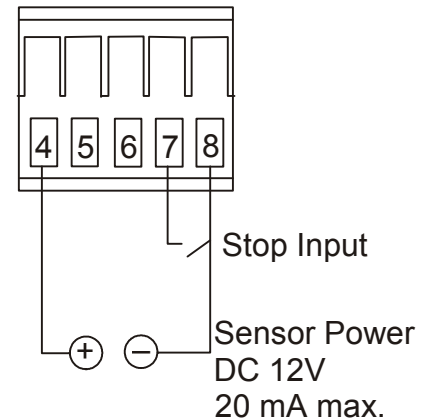

Press **EXT** to operate the pump in external mode. The pump speed will now be determined by the level of the milliamp signal as shown in the graph. The stroke length can be adjusted manually to set the volume pumped per stroke.

C. Pumps using the 'T' Control Module

The EZB-Timer Series is able to operate in Daily, Weekly and 2-Week modes. An external stop input and 12VDC output are also available.

Display/Keypad Overview

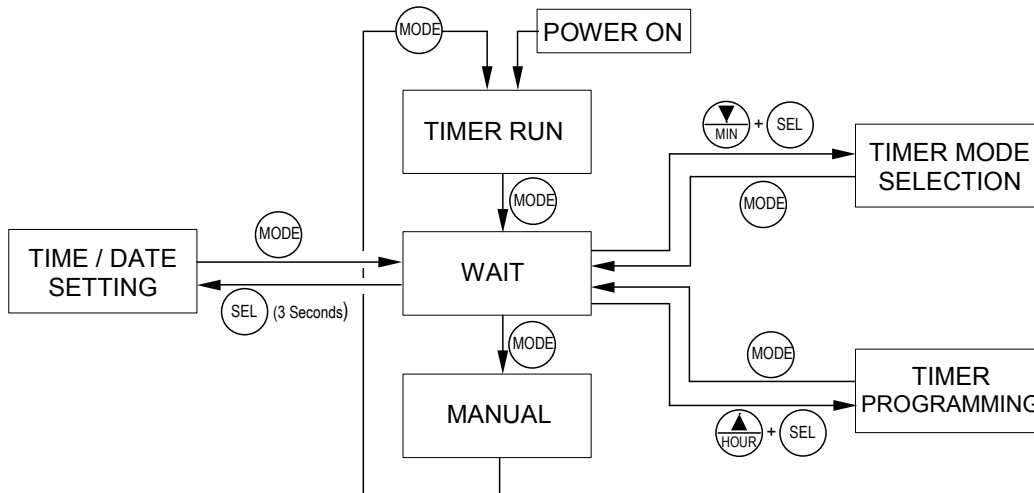

EZ-T Quick Reference Guide

(MODE) Mode Key

(SEL) Select Key

FROM:	PRESS:	TO:
TIMER RUN MENU	(MODE)	Move to WAIT menu
WAIT MENU	(MODE)	Move to MANUAL menu
	(SEL) (Hold for 3 seconds)	Move to TIME / DATE setting menu
	(SEL) + (▲) HOUR	Move to TIMER programming menu
	(SEL) + (▼) MIN	Move to TIMER MODE selection menu
MANUAL MENU	(MODE)	Move to TIMER RUN mode (shows TIME)
	(SEL)	Starts and stops manual operation
	(▼) MIN OR (▲) HOUR	Changes pump frequency (1 to 360 SPM)
TIME / DATE MENU (24 Hour Clock)	(▲) HOUR	Sets the Hour (incrementing only)
	(▼) MIN	Sets the Minutes (incrementing only)
	(SEL)	Selects the Day of the week
	(MODE)	Exits back to WAIT menu
TIMER MODE MENU	(▲) HOUR OR (▼) MIN	Scrolls between DAILY, WEEK or 2-WEEK Timer modes
	(MODE)	Exits back to WAIT menu
TIMER PROGRAMMING MENU	(▲) HOUR	Sets the Hour / Sets On-Time Minutes
	(▼) MIN	Sets the Minutes / Sets On-Time Minutes
	(SEL)	Scrolls through the week days / program #
	(MODE)	Exits back to WAIT menu

Programming and Timer Use

CAUTION! Before use, check the time and date. Set to the local time and date before programming. Incorrect time/date can result in incorrect operation.

1. Manual Operation

From the WAIT menu, pressing the MODE key will enter the manual mode. Pressing SEL will toggle the pump on and off manually. The speed can be changed with the UP and DOWN arrows both running and waiting. **NOTE: The pump speed set in this menu will be the speed that the pump will run during timed operations.**

2. Time/Date Setting

From the WAIT menu, holding the SEL key down for 3 seconds will enter into the Time/Date SET menu. Using the HOUR and MIN keys, the time can be set using a 24-hour clock. The SEL key will cycle through the days of the week. Once the correct time and day of the week are set, pressing the MODE key will go back to the WAIT menu.

3. Timer Mode Selection

Pressing the MIN and SEL keys at the same time will bring up the Mode Selection menu. This menu is where the Timer module is set to control in daily, weekly, or in 2-week modes. Use the UP and DOWN keys to cycle through the three options and MODE to get back to the WAIT menu. Daily mode allows a max of up to 8 timed operations repeated every day. Weekly and 2-week modes allow a max of one timed operation per day.

4. Timer Operation Programming

Pressing the HOUR and SEL keys at the same time will bring up the Timer Programming menu. This menu is where the individual operations are set – both start time and run time.

DAILY MODE:

Initially, the 1-SUN and NUM will both be backlit. NUM is backlit to signal that the number backlit is used – i.e. program 1 in this case. Using the HOUR and MIN keys, the time for the first program can be set (24-hour clock). Pressing the SEL key will change the menu to program the on-time to run the pump (initially shows “ 0M”). Use the UP and DOWN keys to program the # of minutes for the pump to run. Pressing SEL again will then move to program the second program and the backlight will move from 1-SUN to 2-MON. The clock and on-time settings are set in the same manner. Pressing MODE will go back to the WAIT menu.

WEEKLY MODE:

Initially, the 1-SUN will be backlit signifying that Sunday is being programmed. If a program is desired for Sunday, use the HOUR and MIN keys to set the time of the program. If no program is desired for Sunday, pressing the SEL key will scroll through each day’s two programmed settings – the time to start and the run time. Pressing MODE will go back to the WAIT menu at any point in the programming.

2-WEEK MODE:

Two week mode is similar and set just as the weekly mode, only after the first 7-SAT is programmed or passed by and 1-SUN is again backlit, the “2nd” will also become backlit showing that the day is in

the 2nd week. All programming functions are the same and SEL will scroll through each setting. Pressing MODE will go back to the WAIT menu at any point in the programming.

From the WAIT mode, pressing MODE will move to the MANUAL menu. Check to make sure that the pump speed is set at the rate desired during the timed operations. If not, use the UP and DOWN keys to change the pump speed.

Pressing MODE again will display the current time and date. The pump is now operating in the TIMER mode and will come on at the next programmed timer operation.

3.5 STOP Function

Additionally, the EH pumps can be controlled in start-stop mode. In this mode, AC power is applied continuously and pump operation is stopped by completing the circuit between the positive ‘stop’ and common terminals inside the control module (R Control Module: 5 (positive) and 6 (common) Y Control Module: 7 (positive) and 8 (common)). A switch or solid state device capable of switching 10 VDC at 2 mA for the R-Module and 5VDC at 2 mA for the Y-Module. should be used. Switch closed = pump stopped, switch open = pump running at the speed determined by the frequency knob setting. This feature eliminates the need for a high voltage, high current AC relay to start and stop the pump. (See Figures 9 and 11.)

If using the Y Control Module and the pump is operating in external digital mode, any pulses received while the pump is stopped will be saved (up to a maximum of 255). When pump operation resumes, saved pulses will allow the pump to “catch up” by producing the correct number of pump strokes that should have occurred while it was stopped.

3.6 AC Power Interruption (Y-Control Module)

If AC power is interrupted, the pump will power up as shown below:

State preceding power OFF	State following power ON
WAIT	WAIT
Run Manual	Run Manual
Run external	Run external
Set EXTERNAL mode	WAIT
Set External values	WAIT

3.7 Auto Air Vent Valve Operation

The Auto Air Vent Valve is an option on select EH and EZ pumps and replaces the standard Manual Air Vent Valve when ordered. It is used primarily in applications where gassing is a problem and pumps can lose prime.

Unlike the Manual Air Vent Valve, the Auto Air Vent Valve constantly bleeds a controlled amount of volume out of the “Air” vent. Therefore, the “Air” vent should ***always*** be plumbed back to the source tank. During priming, the access knob does not have to be loosened as with a manual air vent valve as pressure is relieved through the vent. The Top Valve Guide assembly uses a bottom seat to ensure that air is not introduced into the discharge media and utilizes a precisely machined top seat that allows air to be quickly purged but limits the amount of liquid returned to the tank. A sleeve valve is used to maintain backpressure within the pump head, which helps speed the purging of air.

3.8 MultiFunction Valve Operation

The MultiFunction Valve is optional on select EH and EZ pumps and replaces the standard Manual Air Vent Valve when ordered. It integrates the air venting/bleeding functions with a back pressure and anti-siphon valve.

Air Vent / Bleed Function

1. Open the air vent by turning the air vent adjustment knob counter-clockwise one to one and a half turns.
2. Operate the pump until all of the air is purged and only liquid is discharged from the air vent drain.
3. Turn the air vent adjustment knob clockwise until it bottoms out and will not turn further.

Back Pressure / Anti-Siphon Valve

1. A spring-loaded diaphragm automatically adds 30PSI of back pressure to the discharge side of the pump when the air vent adjustment knob is closed.
2. If back pressure is not observed, the pressure release knob may be in the release position (the knob is resting in its 'up' location). If this is the case, turn the knob clockwise until it 'clicks' down (approximately ¼ turn).
3. The diaphragm prevents siphoning of chemical through the pump.

Pressure Release

1. Stop the pump operation.
2. Turn the pressure release knob clockwise until it 'clicks' into the release or 'up' location (approximately ¼ turn). If the knob is turned too far, it will 'click' again return to the back pressure or 'down' position. If this happens, keep turning the knob clockwise until it 'clicks' one time in the release ('up') position.
3. Turn the air vent adjustment knob counter-clockwise one or one and a half turns to release the pressure in the discharge tubing/piping through the air vent drain. The air vent drain should always be plumbed back to the supply tank or to safe disposal. Do not submerge the air vent drain tubing under chemical in the supply tank.

CAUTION: Confirm that liquid is discharged from the air vent drain. If the liquid is not discharged, the pressure may not be released. If this is the case, repeat the Pressure Release procedure.

4.0 MAINTENANCE

CAUTION: Before working on the pump, disconnect the power cord, depressurize the discharge tubing and drain or flush any residual liquid from the pump head and valves. Always wear protective gear when working around chemicals.

4.1 Diaphragm Replacement

Disconnect AC power to the pump and disconnect the suction tubing, discharge tubing, and air vent tubing. Remove the four head bolts with a 4mm or 5mm hex wrench. Turn the stroke length knob fully counter-clockwise. Unscrew the diaphragm and remove its retainer (small disk behind the diaphragm).

CAUTION: *There may be small brass spacers between the retainer and the armature shaft. These spacers need to be reused when replacing the diaphragm.* Install the new retainer and diaphragm on the shaft. Turn the diaphragm clockwise until it bottoms on the shaft. Replace the pump head and tighten the head bolts to a torque of 19 lb-in (2.16 N-m).

4.2 Valve Replacement

Remove the suction and discharge tubing making sure discharge side has been depressurized. Remove the suction fitting, two valve cartridges, o-ring and gasket(s). Install the new o-ring, gasket(s) and valve cartridges. Be sure both valve seats are in the same orientation. Refer to Figure below. Tighten the suction fitting. Similarly remove and replace the discharge valve cartridges, o-ring and gasket(s). For a more detailed drawing, refer to the Section 6.0.

Valve Cartridge Orientation

CAUTION: *There are many small parts in the liquid end. These parts must be installed correctly for proper operation of the pump.*

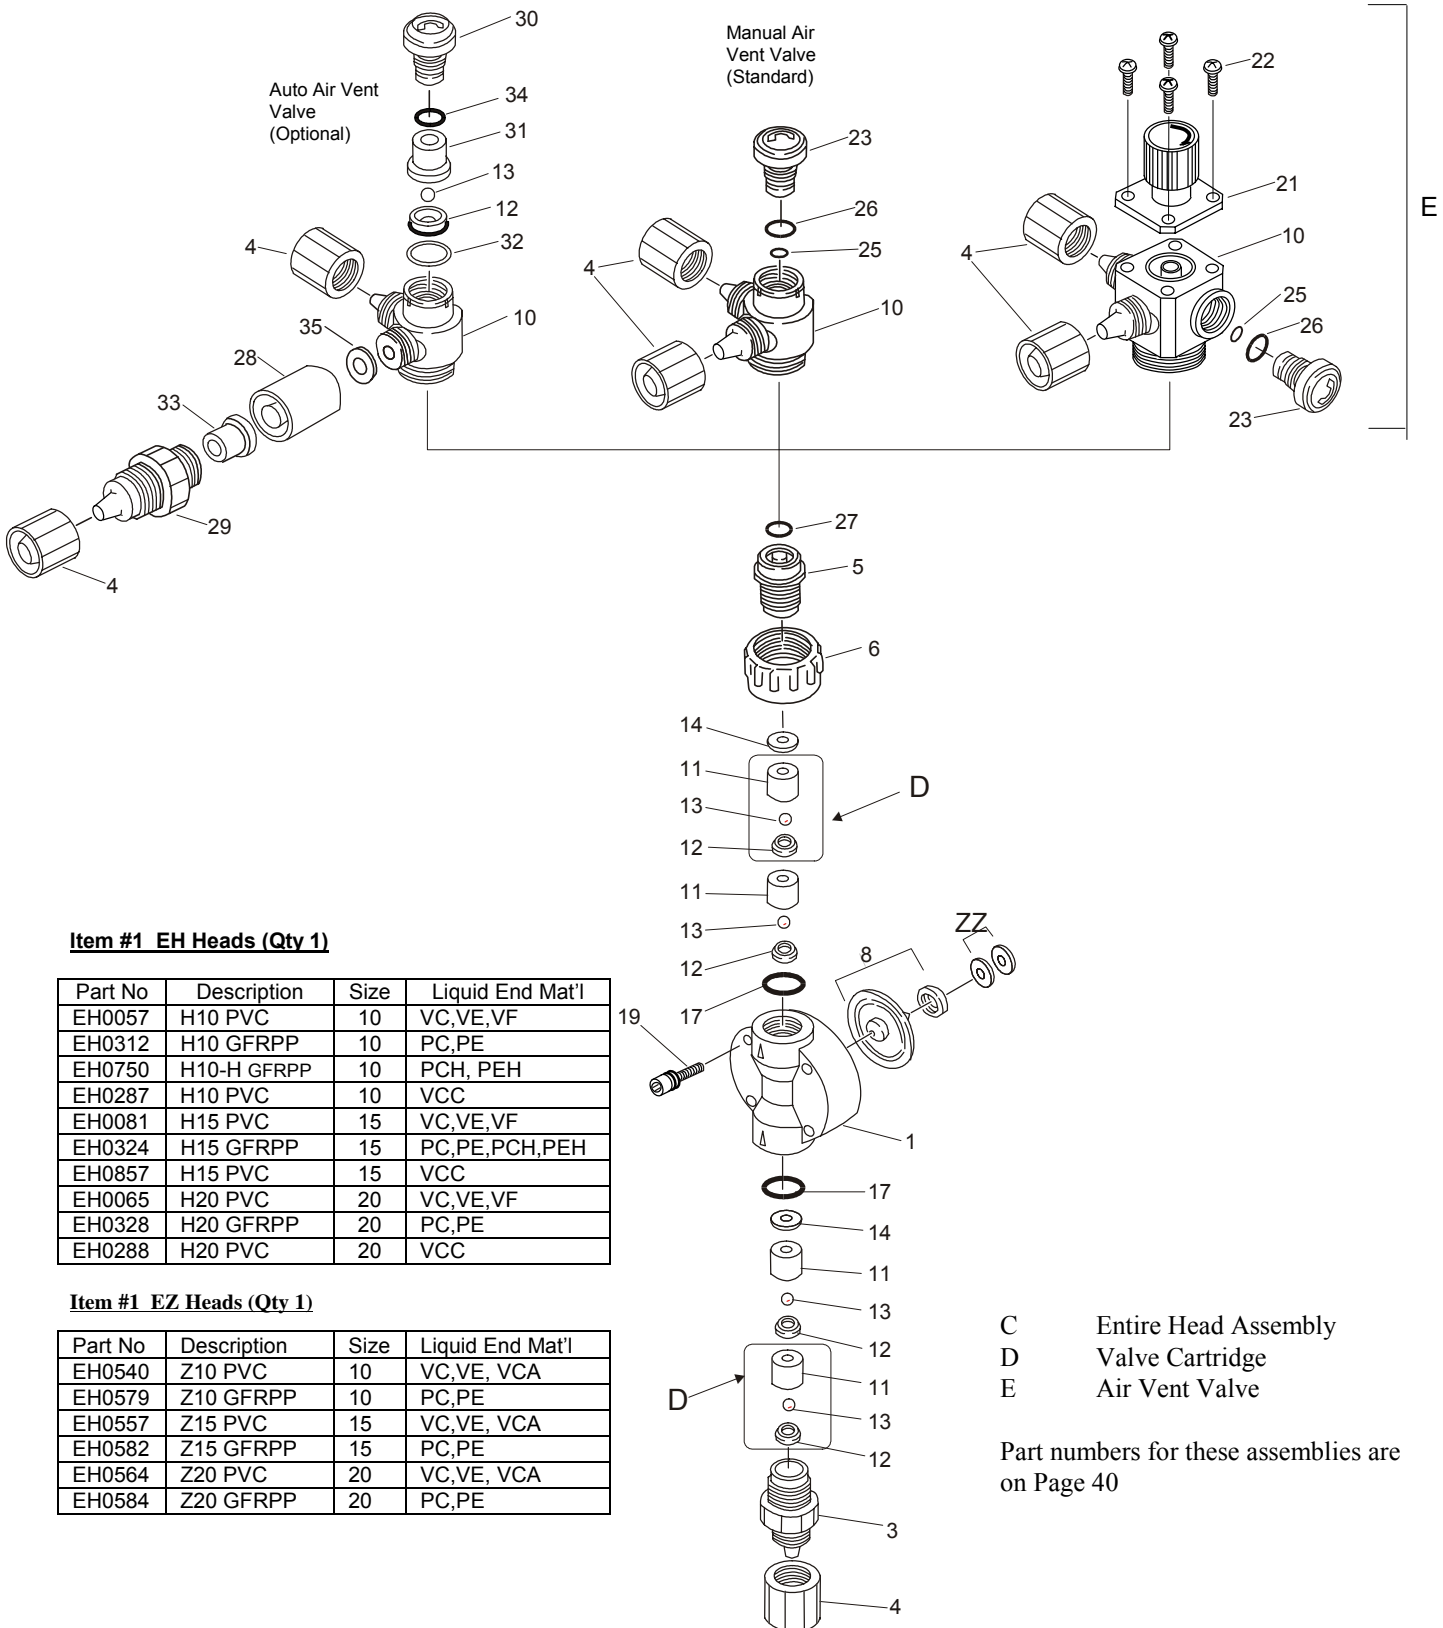

4.3 Tubing

Check ends of tubing for splits, cracks, or thin spots. Examine the full length of tubing for damage due to chafing, abrasion, stress cracks, excessive temperature or exposure to ultraviolet light (direct sunlight or mercury vapor lamps). If any signs of deterioration exist, replace the entire length of tubing. It is a good idea to replace discharge tubing on a regular preventive maintenance schedule every 12 months.

	EH1438	Screw, Self Tap, D-module	EZ-D

Key letters:

A	Drive Unit	D	Valve Cartridge
B	Control Module	E	Air Vent Valve Assembly
C	Head Assembly		

Notes:

“_” To get the correct model or part number, enter a “C” or “B” into the blank space

* The P/N in the block is the head assembly part number; For MFV head assemblies, add an “M” to the end of the part number.
The spare parts kit number is the same as the head assy # except with ‘-PK’ at the end; Parts kits for pumps with Multifunction valves are the same as pumps without the “M” option.

† For pump models using a “Y” Control Module, change the “R” in the model number to a “Y” to determine the correct Control Module part number. Add a “Y” to the end of the drive unit part number for pumps using a “Y” module.

6.0 TROUBLESHOOTING

CAUTION: Before working on the pump, disconnect the power cord, depressurize the discharge tubing and drain or flush any residual liquid from the pump head and valves, using proper chemical handling techniques.

<u>Problem</u>	<u>Possible Cause</u>	<u>Corrective Action</u>
<i>Pump does not start</i>	Faulty wiring	Correct wiring
	Improper voltage	Connect to proper voltage source
	Electronic control unit is damaged	Replace control unit
<i>Pump does not prime</i>	Pump stroke length is too short	Operate pump with stroke length set at 100% until primed. Then set stroke length as needed to obtain desired output.
	Air in suction tubing	Reroute suction tubing to eliminate air trap
	Valve gasket is not installed	Install valve gasket
	Valve set assembly direction is wrong.	Reassemble valve set
	Pump is air locked	Open air vent valve
	Suction or discharge valve is clogged with foreign matter	Disassemble, inspect, clean
	Ball stuck to valve seat	Disassemble, inspect, clean

<u>Problem</u>	<u>Possible Cause</u>	<u>Corrective Action</u>
<i>Output fluctuates</i>	Suction or discharge valve is clogged with foreign matter	Disassemble, inspect, clean
	Air is trapped in pump	Open air vent valve
	Overfeeding	Install injection valve or back pressure valve
	Diaphragm is damaged	Replace diaphragm
<i>Liquid leaks</i>	Fitting or coupling nut is loose	Re-install (see section 2.3/2.4)
	Pump head is loose	Tighten pump head bolts Torque: 19 lb-in (2.16 N-m)
	Diaphragm is damaged	Replace diaphragm
	O-ring or valve gasket missing	Install o-ring or valve gasket

7.0 SERVICE POLICY

The EH and EZ Series electronic metering pumps have a 2-year warranty. Contact your Walchem distributor for service.
