

Learn More about WebAlert v9 Software Upgrade

10/4/2011

New Features:

- Added a one-point calibration to analog inputs
- Added a Reset Default Calibration button to analog inputs
- Added alarm deadband to analog inputs
- Added High-High and Low-Low alarms to analog inputs
- Added Damping to analog inputs
- Added the Automatic Total Reset feature to analog and digital flowmeters
- The state of Generic digital inputs are now logged in the Event Log
- VTouch-VNet activation key is included without requiring it to be imported
- Able to select whether to delete the Manual Datalog upon download or not
- Min/Max/Average values are calculated every 15 seconds instead of every 10 minutes

Improvements:

- Faster page loading
- Improved VTouch connection reliability, improved DHCP function
- Symbols that can cause problems are no longer allowed to be used in custom names
- Several improvements to datalogs; all data will have the same precision as seen on the web pages, inputs that change type or are no longer used will be removed from the logs, monthly reports will be emailed on time, the units of measure will be displayed correctly
- Graphing/Trending page is more reliable; graphs export correctly, use the correct date format
- All types of parameters are now included in the Configuration File
- Rounding errors eliminated from water meter totals
